

The Web Page should contain two tabs

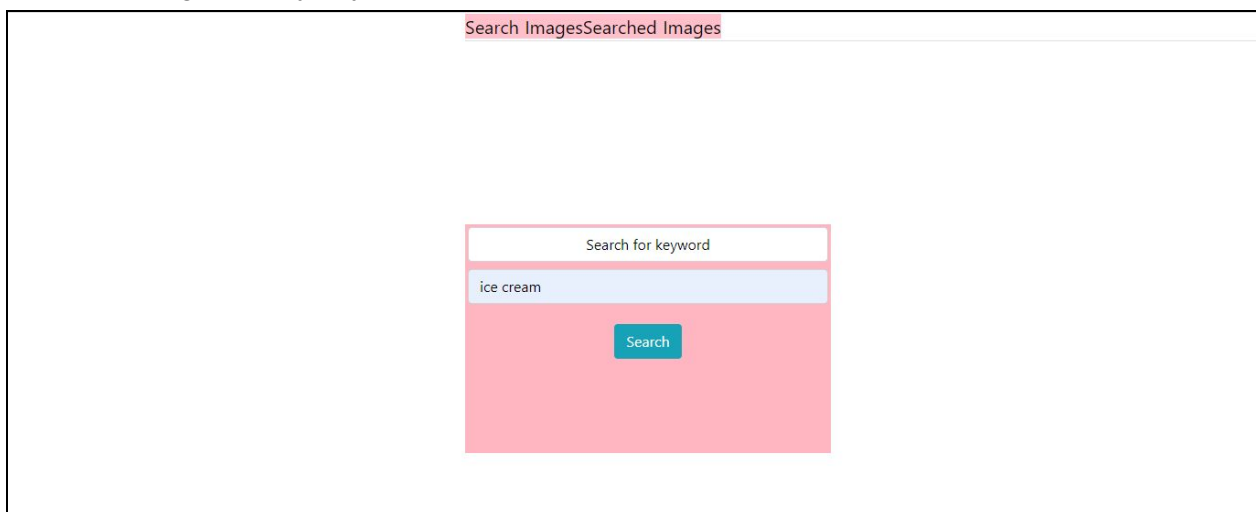

- 1.Search Images
- 2.Searched Images

1.The Search Images tab contains search bar and button for searching images

after searching with any keyword,for example ice-cream and click on the search button.

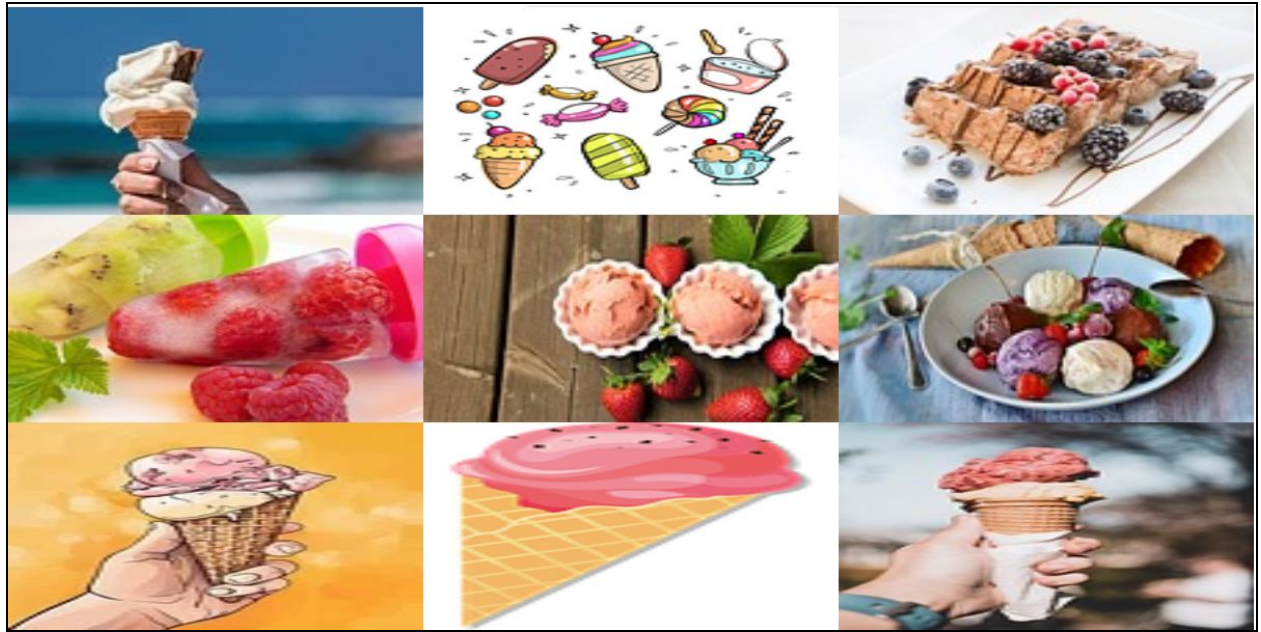

It should fetch the 15 images from Public API and display them on the same webpage. And also at the same time we need to store these images in a local folder/some location.

2.Now,when we go to the Searched Images Tab ,it should contain the already searched keywords.for example, recently we have searched for ice cream keyword .

On this page,when we click on any keyword ,for suppose ice cream-the images should come from the local folder and display them in a beatiful grid layout (these images should open on another page) .
